

Biotic and abiotic degradation studies of organic contaminants

Manuela Peschka

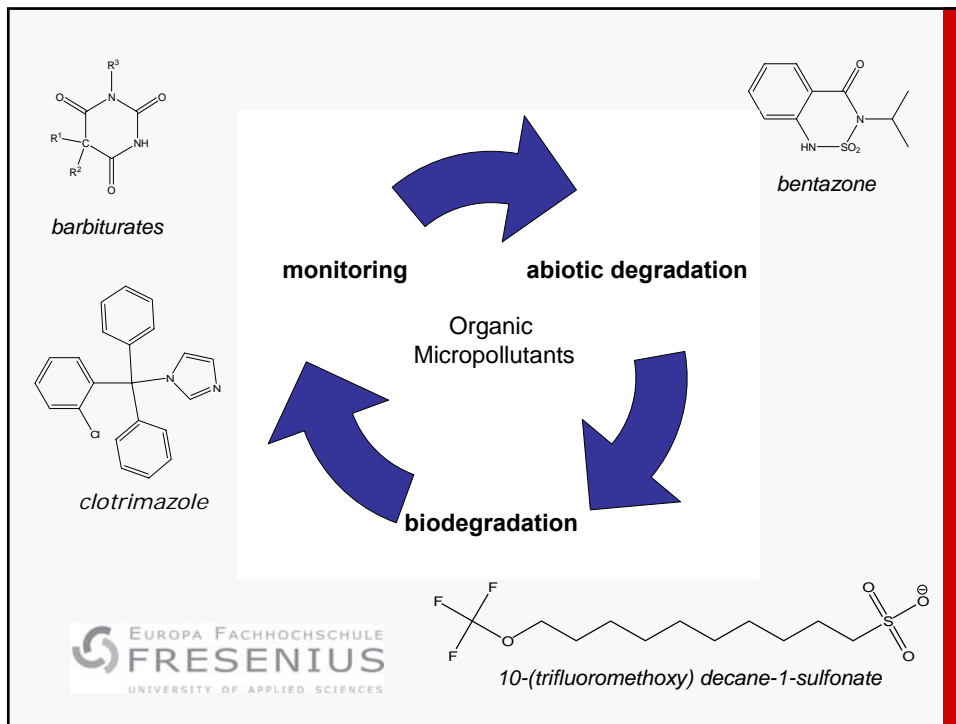

Ankara, 8th October 2007

Outline

- **Organic pollutants**
Selected compounds
- **Simulation of abiotic/biotic degradation**
Fixed bed bioreactor
Bottle test
Suntest
- **Analysis of micropollutants and identification of transformation products**
Sample pretreatment
Analytical Instrumentation
- **Results:**
Case study I: barbiturates
Case study I: photodegradation of bentazone
Case study II: biodegradation of a new fluorosurfactant
Case study IV: biotransformation of clotrimazole

Degradation Tests:

Fixed Bed Bioreaktor

Bottle Test

Suntest – simulation of abiotic photodegradation

Sample Pretreatment:

OAIS® HLB

Reversed Phase material with **Hydrophilic – Lipophilic Balance**

A = 810 m²/g

pore diameter = 80 Å

V = 1,3 cm³/g

particle diameter = 60, 30, 25, 15 und 5 µm

OAIS® MCX

Mixed-Mode Cation eXchange and Reversed Phase
1,0 meq/g SO₃H Ion exchange capacity

OAIS® MAX – Phasenchemie

Mixed-Mode Anion eXchange and Reversed Phase

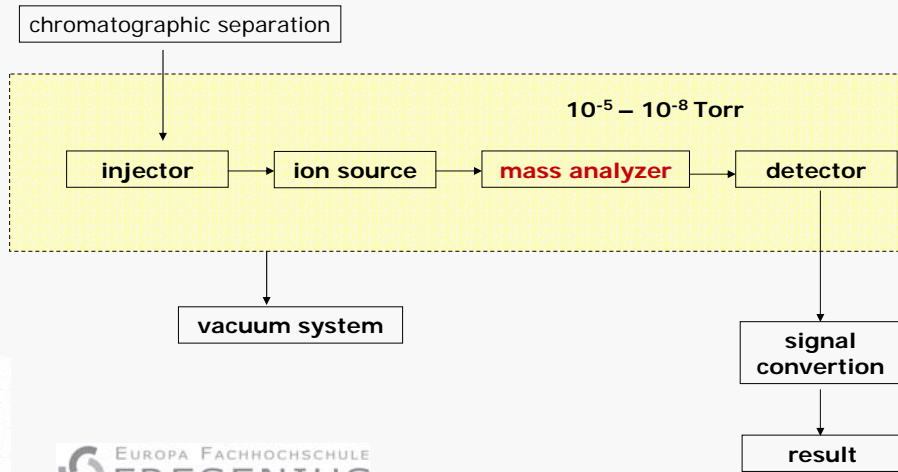

Elution (for non polar SPE)

- typical solvents:
 - methanol
 - methanol with acid
 - methanol with base
 - acetonitrile
 - acetic acid
 - THF
 - acetone
 - dichlormethan, chloroform
 - hexane

Analytical Instrumentation:

General setup of a mass spectrometer

GC-MS

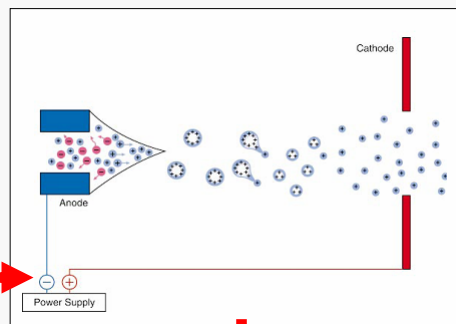

Advantage: utilization of mass spectra libraries
strong fragmentation gives structural information

Disadvantage: single MS
EI only in combination with GC

LC-MS

Advantage: - analysis of polar, thermolabile compounds
 - very robust for routine analysis

Disadvantage: - no spectral libraries
 - matrix effects

Quadrupole Time of Flight Mass Spectrometer

$$E_{kin} = \frac{1}{2} * m * v^2 = z * e * U$$

$$\frac{1}{2} * m * \left(\frac{1}{2}\right)^2 = z * e * U$$

$$\frac{m}{z} = (2 * e * U) * \frac{t^2}{L^2}$$

Advantage:

- high resolution, e.i. determination of up to the fourth decimal (e.g. 255.0432 amu)
- determination of the elemental composition
- MS²

Disadvantage: - not sensitive

QqLIT

- user can select various modi, e.g. Q1MI, MRM, product ion scan
- enhanced modi: Q3 acts as trap resulting in higher sensitivity

Advantage:

- structure elucidation of unknown compounds
- high sensitivity

Disadvantage: ?

Ion chromatography

- determination of inorganic parameter, e.g. SO_4^{2-} , Cl^- , F^-
- mineralization of a molecule

monitoring

LC-MS

GC-MS

structure elucidation

QqLIT

(IC)

QqTOF

Case studies:

Barbiturates

~~Fixed Bed Bioreactor~~
~~Exposure to sunlight~~
~~Hydrolysis (pH 2 - 12)~~

→ groundwater in Berlin

Bentazone

- one of the most applied herbicides in the Ebro river delta
 - 31 µg/L in application time from May to August (mean value) (Ebro 0.27 µg/L)
 - comparable high concentrations river waters of the Tiber region in Italy
- not biodegradable in a fixed bed bioreactor
 - passes through membrane bioractor
 - present in ground- and surface water

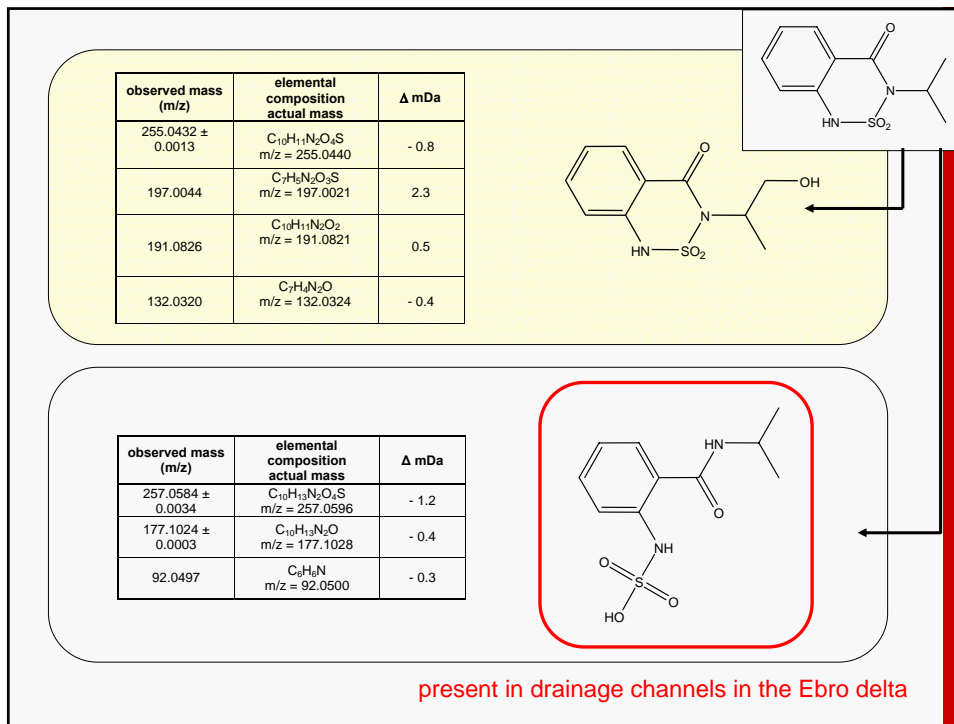

A – distilled water

B - moderately hard water

C – moderately hard water
plus 5 µg/mL humic acids

Fluorosurfactants

properties:

- persistent to hydrolysis, oxidation, reduction and biodegradation
- accumulate in liver, kidneys, mussel tissue and bind to blood proteins

Biodegradation in a Fixed Bed Bioreaktor

10-(trifluormethoxy)decane-1-sulfonate

β = 100 mg/L
V = 5 L surface water
pH 7
T = room temperature (20°C)

Analytical methodologies

Ion Chromatography
F⁻, SO₄²⁻, TOC

Q-Trap

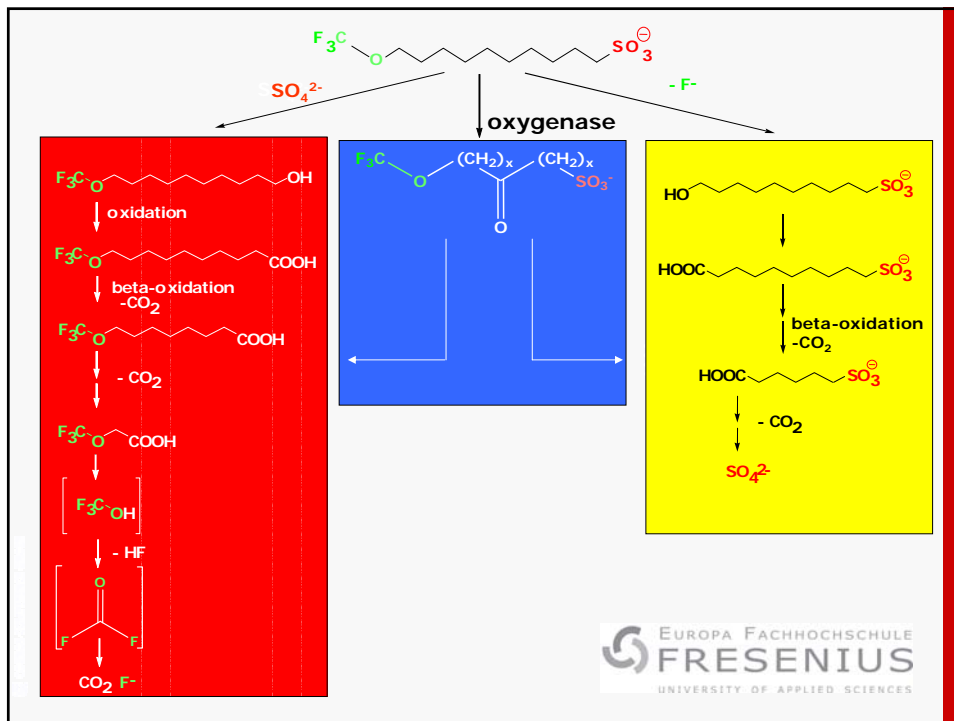

Q-ToF

high resolution
mass spectrometry

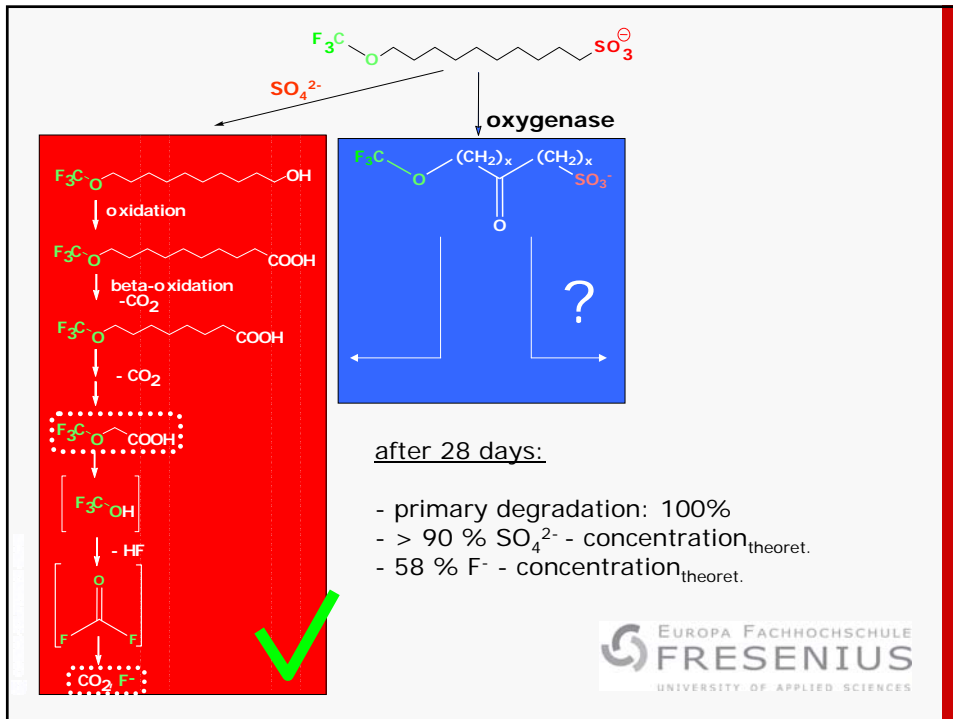

mass spectrum of 10-(trifluoromethoxy)- decane-1-sulfonate

Monitoring of TOC, F⁻ and SO₄²⁻

False positive signal in next four measured samples
(solvent - acetone)!

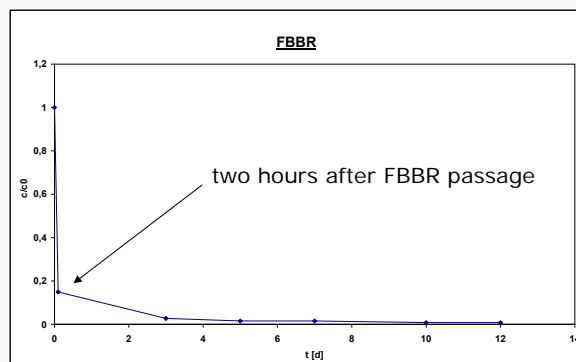

Log K_{ow} versus pH

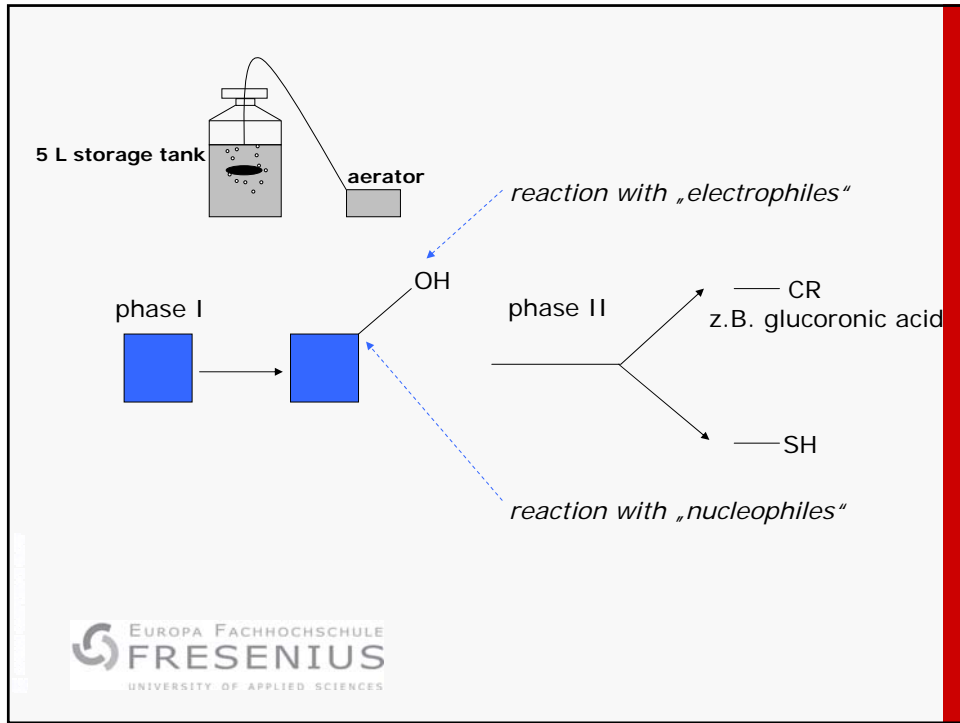

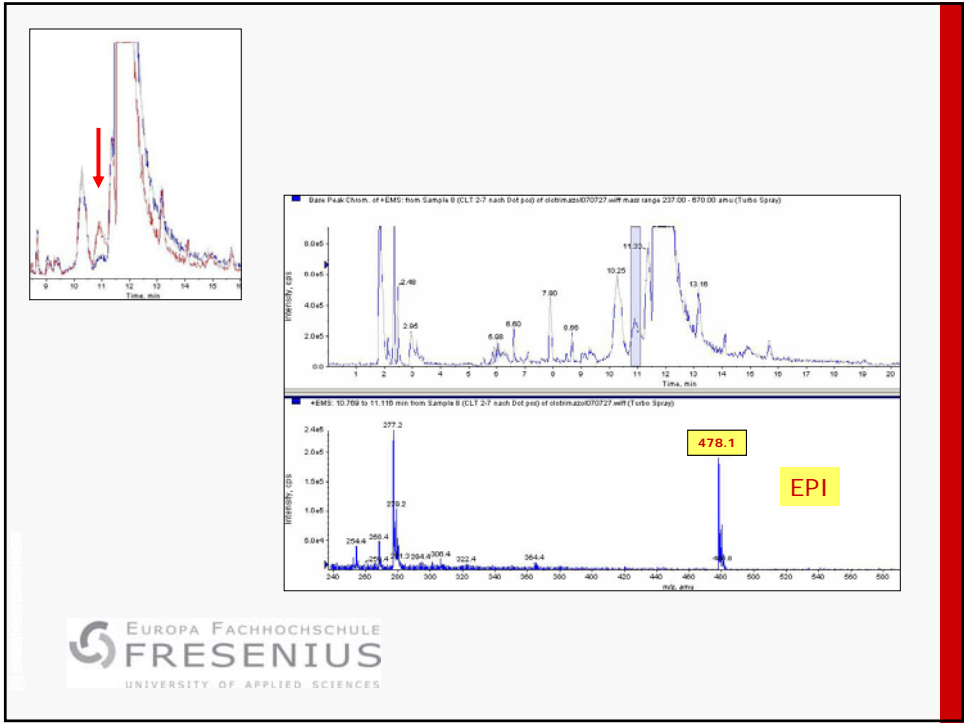

adapted SPE-Method

- Acidification to **pH 2** (stirring 30 min) of samples before filtration
- SPE-Material Oasis HLB 3cc (60 mg), Waters
- conditioning: 1 x 2 mL n-hexan, 3 x 2 mL methanol
5 x 2 mL groundwater (**pH 2**)
- SPE: 100 ng Atrazin D5 (internal standard)
flow approx. 20 mL/min
- drying: 45 min (N₂)
- elution: 4 x 1 mL acetone
- evaporation: to 150 µL
- external standard: 100 ng Fluazifop-buthyl (ESTD) and fill up to 200µL final volume with acetone

Adsorption hinders standardized biodegradation tests

Summary:

no biotic nor abiotic degradation
⇒ **persist in the aquatic environment for several years**

biotransformed
⇒ **further investigations**

barbiturates
clotrimazole

Fate
&
Degradation

bentazone

no biotic degradation but undergoes photolysis
⇒ **degradable in sunlight exposable compartments**

new
fluorosurfactant

undergoes biodegradation
⇒ **potential substitute for the harmful fluorosurfactants presently used**
